

PDFsuite (including PDFmaker)

Time and again we hear people saying that they use Windows machines for making/viewing PDF files (electronic documents), in the belief that RISC OS is fundamentally deficient in this area. To counter this, we're launching PDFsuite - an affordable CD containing everything you need to view, print and create PDF files on RISC OS machines (OS 3.5+).

PDF files have become the standard for cross-platform "DTP-style" documents (ie. with all your fonts, pictures and formatting retained). They are ideal for sending to colleagues or friends running on different platforms, and for distributing documents on the web. PDF is, in many ways, essential for RISC OS users, because we use programs like Ovation Pro or Impression, which have their own file formats, not recognised in the world at large. If you could go directly from Impression, Ovation, Draw, FireWorkz, or any number of other programs, straight into PDF, then your documents would be accessible on any other platform.

Enter PDFmaker, a major part of the Suite, developed in-house here at R-Comp. This software allows you to create PDF files from almost any application in just a couple of clicks. Attractively presented, and a doddle to use, PDFmaker lets you drag a PDF straight out to your hard disc, or fine tune quality settings if you wish.

The Suite also includes PDF viewing software, capable of running on all machines 3.5+ without the need for updated C libraries or any other hassles. You can quickly proof your PDF files, or view/print downloaded documents.

But surely setting all this is complicated? Amazingly, PDFsuite (including PDFmaker) can be installed in just four clicks... Click on the CD icon on the iconbar, 2 clicks on the installation program, and finally one click on "Install". Your computer will be set up to view and create PDFs.
